

TechTip: Simple Macros in Weintek HMI

Posted on **13 September 2018** by **Duncan Stanton**

Weintek HMI have a very powerful macro language enabling scripts to be written to implement control, perform calculations and much more. For those new to macros it can be quite daunting to get started. The example shown in this TechTip Article are designed as a “leg-up” to get you started with macros.

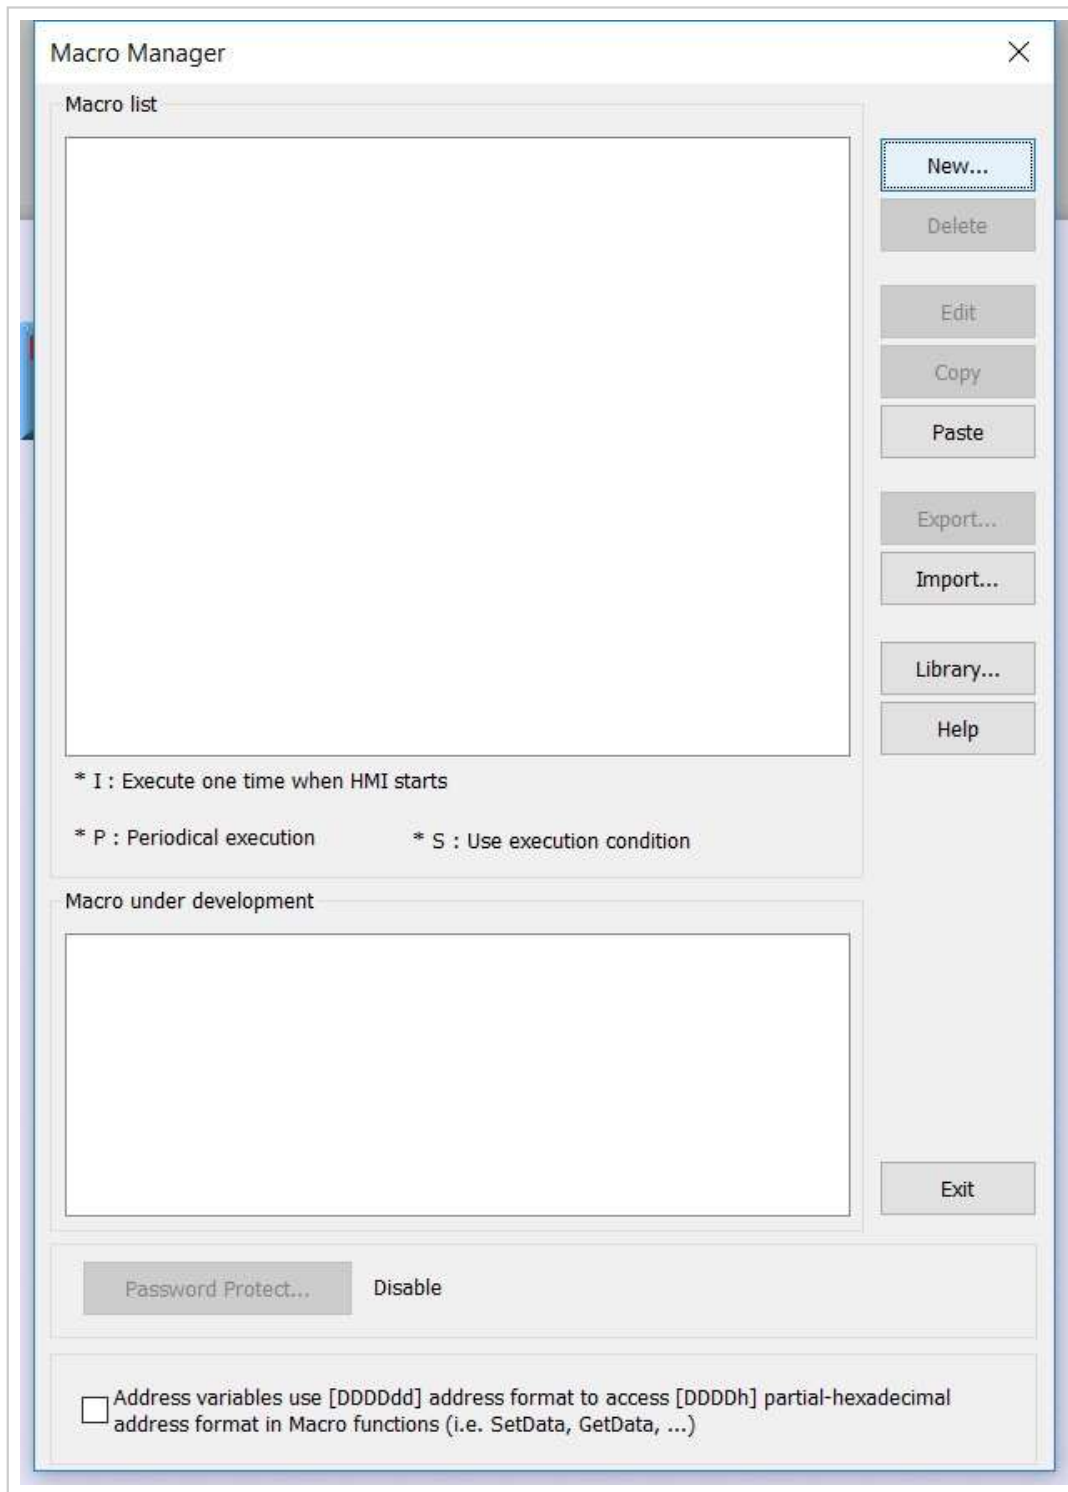

Step 1

The Macro button is on the project tab within EasyBuilder Pro:

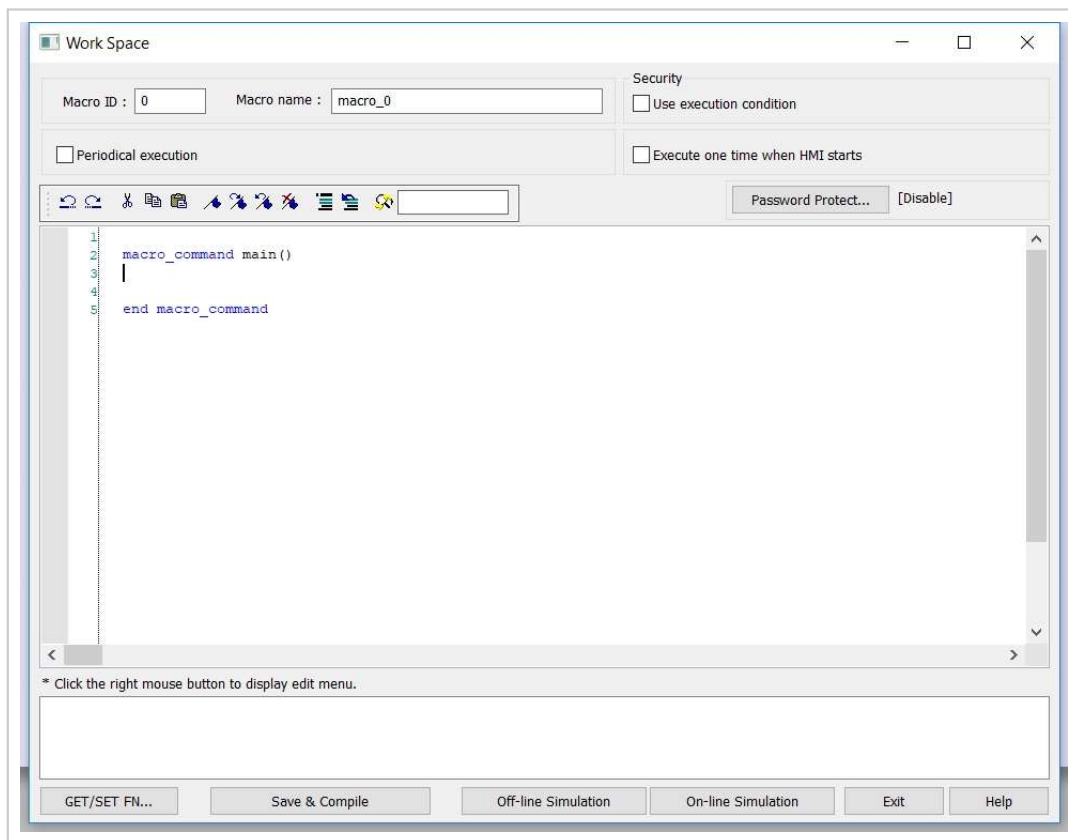

Step 2

We need to create a macro by clicking “New...”

Step 3

Let's break down what you need to know to get started with writing a macro.

First off we need to declare variables. These are, but not limited to “short”(16-bit number), “int”(32-bit number), “bool” (a bit). It is a good idea to comment macros (using //) because what you write now may not make sense in the future!

```

macro_command main()
//declare variables
short number1 // variable declaration for number1
short number2 // variable declaration for number2
short result // variable declaration for result

```

Next up, in our example, we are going to get some data from the HMI local LW registers - but this could equally be a PLC or connected device register. There’s a handy wizard for this “GET/SET FN...”

API

☒ Build-in ☐ Library

Category : All

Function name : GetData

GetData(number1, "Local HMI", LW, 0, 1)

[Description]
Read data from a device.

[Usage]
GetData(desti, PLC name, device type, address, data count)

[Example]
char byData[10]
short wData[6]

Variable 1
Variable type : short (16-bit)
Variable : number1

Read address
Device : Local HMI
Address type : LW
Address : 0 ☐ System tag ☐ User-defined tag
Address format : DDDDD [range : 0 ~ 12000]
BIN Data count : 1

OK Cancel

GetData(number1, "Local HMI", LW, 0, 1) //Get the Value in LW0 and put it in the variable, number1

GetData(number2, "Local HMI", LW, 1, 1) //Get the Value in LW1 and put it in the variable, number1

Then..perform action or calculation:

result = number1 + number2 // perform the calculation and put the result in "result"

Now our result has been calculated, we need to put that into an LW register so we can display it on the HMI:

SetData(result, "Local HMI", LW, 2, 1) // Put "result" into LW2

end macro_command

Put all that together and our macro is:

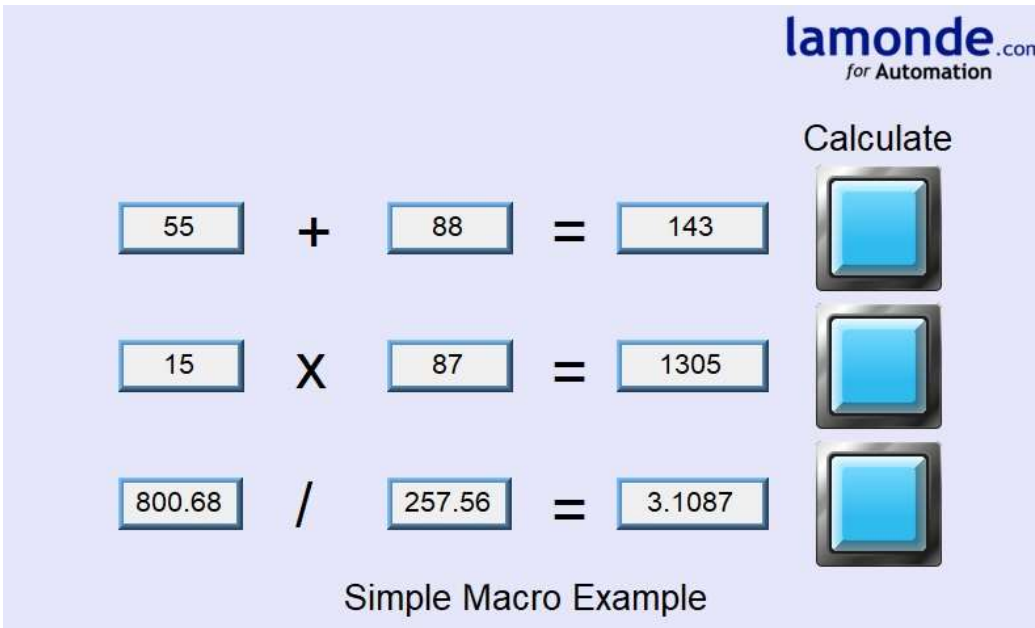

```
macro_command main()  
//declare variables  
short number1 // variable declaration for number1  
short number2 // variable declaration for number2  
short result // variable declaration for result  
  
GetData(number1, "Local HMI", LW, 0, 1) //Get the Value in LW0 and put it in the variable, number1  
GetData(number2, "Local HMI", LW, 1, 1) //Get the Value in LW1 and put it in the variable, number1  
  
result = number1 + number2 // perform the calculation and put the result in "result"  
  
SetData(result, "Local HMI", LW, 2, 1) // Put "result" into LW2  
  
end macro_command
```

Click "Save & Compile" and assuming you have no errors you're done!

Step 4

A macro can be time-based and run all the time, or it can be triggered - this can be done with a button on the HMI.

An example project performing addition, multiplication and division by macro can be [downloaded here](https://news.lamonde.com/2018/09/13/techtip-simple-macros-in-weintek-hmi/):

The screenshot shows a Weintek HMI interface with the Lamonde Automation logo in the top right corner. The main area displays three arithmetic calculations, each with a 'Calculate' button to its right:

- 55 + 88 = 143
- 15 X 87 = 1305
- 800.68 / 257.56 = 3.1087

Below the calculations, the text 'Simple Macro Example' is centered.
